

## Geography

Your garden is an ecosystem. The shade and sun, types of soil, amount of water are unique to your garden and what you have in it. Draw a map of your garden. Show different surfaces like grass and concrete or stone, show large trees and bushes, shady areas and very sunny places. Create a key to identify these different things.

Label or draw things around the outside of your map like where the grass has gone crispy (like in my garden) or where you find most woodlice, slugs and millipedes. Where do the birds hang out and where do you hang the washing. All these are chosen because of the conditions of that ecosystem.

Don't forget a key!
